#### *Abstract*

Focuses on the determinants of school attendance and work force participation among children (specially, those in the age group of 5-14 years). This issue is investigated in a multivariate framework, using both household-level data (from the Census and related sources). The potential determinations of school attendance and work force participation that are investigated include adult literacy, economic status, social background, access to school facilities, and school incentives, among others. Studies district as well household level data to understand better the socio economics determinants of participation in education at the elementary level.

#### *Contents*
